

CHARACTERISTICS:

POPILLIA TRAP is a trap for the monitoring and the mass trapping of the adults of *Popillia japonica*, a beetle that attacks many agricultural and ornamental crops, causing defoliation. The trap is based on the attraction that specific components (floral attractants and pheromones) have towards the insect.

- Method with non-toxic action
- It catches exclusively *Popillia japonica* adults
- Great bag capacity
- Whole-season lasting lure (up to 10-12 weeks)

INSTRUCTIONS FOR ASSEMBLY AND USE

- Open the package and assemble the capture cone by inserting the tabs in the appropriate joints.
- Open the pheromone tray and insert it into the appropriate slots in the dividing panel of the trap, making sure that the holes match with the pheromone tray.
- Insert the divider into the cone framing it both in the lower and upper part.
- Firmly attach the bag to the bottom of the trap using the appropriate cuts and the strap on the bag.
- Hang the trap.

If the bag is 2/3 full, it is recommended to empty it. Remove the bag from the trap, empty it from the trapped insects in the trash bag.

TRAP POSITIONING:

Preferably place the traps at least 10 mt from the crop to protect (in order to avoid damages to the closer plants) at 1,2-1,5 m height.

Keep a 15-20 m distance between the traps. Do not exceed the 20 traps/ha.

WARNINGS:

Keep out of reach of children. If stored in the refrigerator and sealed in their original packaging, the attractants have a 3 years' duration.

CAUTION: POPILLIA TRAP attractants can be also used employing TOTEM TRAP as trapping system.
