

**FIELD OF USE:**

**ECOTRAP** is the new trap system for the capturing of flies with an aggregation lure.

**COMPOSITION:**

**ECOTRAP** has been designed to capture diptera, by using a special lure with a continuous fermentation (Bramalin): it consists of a mixture of plant extracts, animal proteins and aromatic herbs.

**CHARACTERISTICS:**

**ECOTRAP** represents the easiest method to eliminate flies, horseflies and other insects, in a natural way, without the help of pesticides, in accordance with the new existing legislation. **ECOTRAP** is environmentally friendly and reduces the several problems (of hygienic, sanitary, qualitative and economic nature) that would have resulted from the use of venoms.

The trap is successfully used in those areas with a high concentration of flies, such as: livestock and poultry farms, landfills and composting centers.

**INSTRUCTIONS FOR USE:**

**ECOTRAP** is easy to use. Prepare the attractive lure, following the instructions included into the packaging. Pour the product into the trap and complete the assembly. **ECOTRAP** should be hung at about 150-200 cm from the ground, preferably in shady and ventilated areas (at a distance of about 2-5 m from houses, stables and canopies). To ensure the proper functioning of **ECOTRAP**, it is essential to have a temperature above 15°C: the higher the temperature, the greater the effectiveness of the trap. The attractive efficiency of the lure depends on the entity of the infestation: usually, it lasts about one month.

**Packaging:** 20 units

**Contents:** 1 trap, 2 Bramalin lures, 1 fermenter bottle
