

**FIELD OF APPLICATION:**

CETONIA TRAP should be used for the mass trapping and the monitoring of *Cetonia aurata*, both on herbaceous crops and trees, including hedges and ornamental flowers.

COMPOSITION:

CETONIA TRAP is supplied with a capture device and a pheromone lasting 6-7 weeks (aggregation pheromones).

INSTRUCTIONS FOR USE:

It is recommended to install at least 10-15 traps per hectare, starting from the end of April, respecting these indications:

- Within the farms, it is recommended to direct captures towards the areas that are more favourable to the insect development.
- For mass trapping, place 10-15 traps/ha, at about 1.5 m from the ground.
- Place the traps on plants that are attractive for *Cetonia aurata*, possibly with flowers and within 20-30 m from a building (especially at the beginning of the season).
- **WARNING: in case of high populations of *Cetonia aurata*, there may be an increase in damages on the plants where the trap is placed. Select plants which are on the border of and/or external to the crop to concentrate as many specimens as possible.**
- Check and empty the traps daily.
- Change the pheromones, according to the supplier's instructions.

WARNINGS:

The trap must be repositioned in a different place in case the captures are low.
