

CHARACTERISTICS:

ANOMALA TRAP should be used for the mass trapping and the monitoring of *Anomala vitis* on all crops attacked by this phytophagous. ANOMALA TRAP is supplied with a capture device and an aggregation pheromone lasting 6-7 weeks.

INSTRUCTIONS FOR USE:

It is recommended to install at least 10-15 traps per hectare, starting from the mid May/beginning of June.

- Place 10-15 traps/ha, at about 1.5 m height. In case of severe infections, it is preferable to install the traps on the parcel borders.
- Check and empty the traps daily.
- The pheromone is usually sufficient for the whole season. Anyway, it is possible to buy spare pheromones.

WARNING: in case of high populations of *Anomala vitis*, there may be an increase in damages on the plants where the trap is placed. It is therefore preferable to install ANOMALA TRAP on the borders and/or on the exterior of the parcel in order to concentrate the greater amount of pests outside from the plants to be defended.
