

## CHARACTERISTICS:

CETONIA TRAP should be used for the mass trapping and the monitoring of *Cetonia aurata* on all crops attacked by this phytophagous. CETONIA TRAP is supplied with a capture device and an aggregation pheromone lasting 4-6 weeks.

## INSTRUCTIONS FOR USE:

It is recommended to install at least 10-15 traps per hectare, starting from the end of April/beginning of May.

- Place 10-15 traps/ha, at about 1.5 m height. In case of severe infections, it is preferable to install the traps on the parcel borders.
- Check and empty the traps daily.
- It is possible to buy spare pheromones.

**WARNING:** in case of high populations of *Cetonia aurata*, there may be an increase in damages on the plants where the trap is placed. It is therefore preferable to install CETONIA TRAP on the borders and/or on the exterior of the parcel in order to concentrate the greater amount of pests outside from the plants to be defended.
